

DT-Popclip version 1.3b

BETA

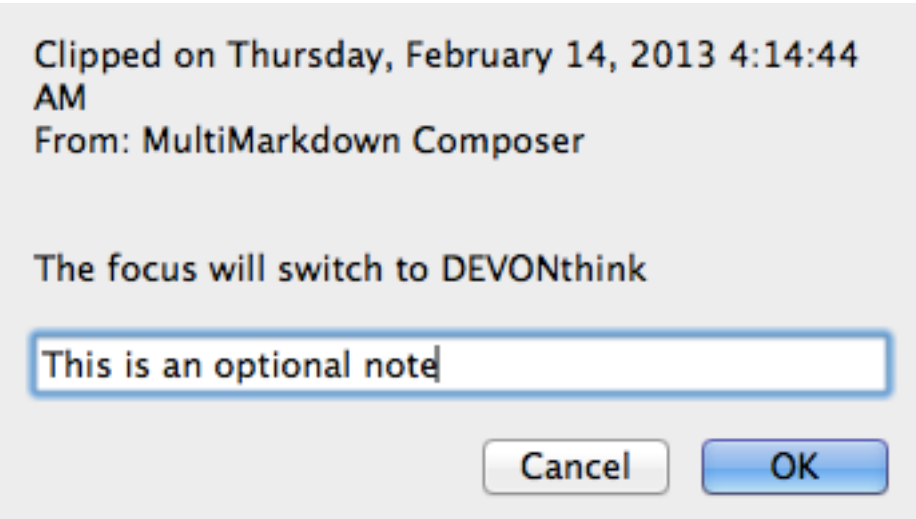

This is a PopClip extension for DEVONthink

Please post any questions in [DT-Popclip Issues](#)

To install. First, be running OS X on a Mac and have the most recent version of PopClip running. Download a zip file from this page and double click **DEVONthink.popclipext**

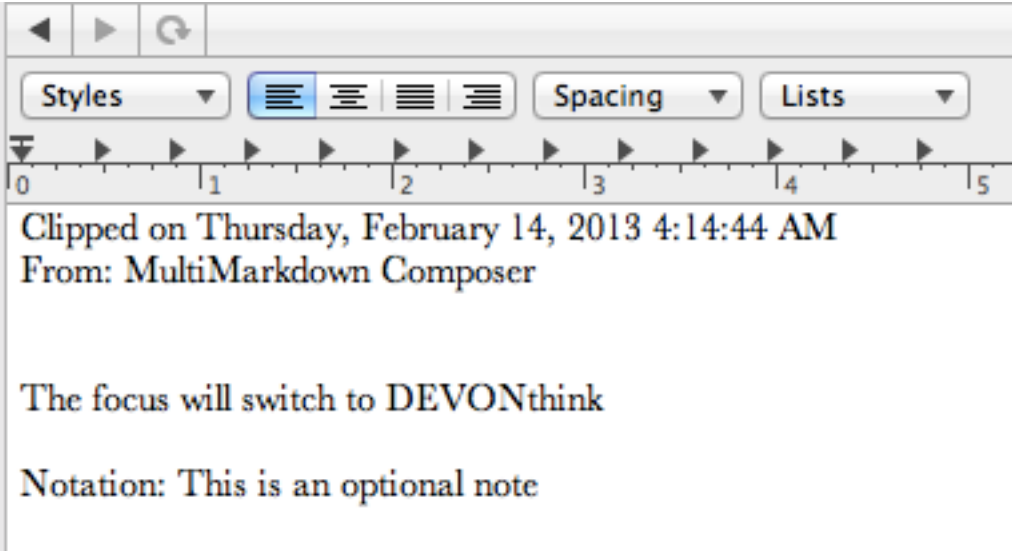

To Use:

- Be running DEVONthink
- Use PopClip as usual.
- When the DEVONthink extension is activated, click the DEVONthink icon from PopClip’s menu.
- The focus will switch to DEVONthink, and a dialog will open showing the text that will be clipped, along with header information:
 - clipped-on date
 - clipped-from application source
 - if you are clipping from Safari, the URL of the page from which you clipped the text
- A text entry field will appear at the bottom of that dialog box where you may OPTIONALLY enter a notation regarding the text you clipped.^[1]

Dialog

- After clicking **OK** in the dialog, the DEVONthink group selector dialog will open, allowing you to choose the destination database and group for the clipping.
- Click “**OK**” in the group selector, and the clipper will create a rich text (RTF) document congaing the header, the text, and the notation.^[2]
- The focus will then return to the app from which you made the clipping

Sample file created in DEVONthink

1. A future release of **DEVONthink.popclipext** will probably make the dialog and notation optional. ↩
2. A future release may make the **Group Selector** dialog optional. ↩
